PRIORITY DOCUMENT

SUBMITTED OR TRANSMITTED IN COMPLIANCE WITH RULE 17.1(a) OR (b)

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Signed P. Mahoney

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents ct 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

a) *If you need help to fill in this form or you have any questions, please contact the Patent Office on 01645 500505.*

b) *Write your answers in capital letters using black ink or you may type them.*

c) *If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.*

d) *If you have answered 'Yes' Patents Form 7/77 will need to be filed.*

e) *Once you have filled in the form you must remember to sign and date it.*

f) *For details of the fee and ways to pay please contact the Patent Office.*

IMPROVED DRUG DELIVERY SYSTEM

The present invention relates to an improved drug delivery system and, in particular, to an improved drug delivery system for the oral administration of lipophilic poorly water-soluble drugs in immediate release dosage forms.

The bioavailability of lipophilic, poorly water-soluble drugs when administered orally in solid dosage forms (such as tablets) is notoriously low and variable. This has led to the development of dosage forms in which the drug is pre-dissolved in either a lipid vehicle or a mixture of a lipid vehicle and a surfactant or a ternary mixture of a lipid vehicle, a surfactant and a co-solvent. Such compositions provide an increased bioavailability of the drug but only at the cost of increased complexity and, in most cases, the need to include very high levels (30% or greater) of surfactant or emulsifier.

Existing lipid-based delivery vehicles for lipophilic drugs include the simple solution of the drug in a lipophilic vehicle, self-emulsifying oil systems, micro-emulsions and liposomes. The properties and application characteristics of lipophilic drug delivery vehicles have been the subject of numerous reviews - for example, *Humberstone & Charman (1997) Advanced Drug Delivery Review v.25, 103-128 and O'Driscoll (2002) European Journal of Pharmaceutical Science v.15, 405-415.*

Lipophilic Solution.

A number of drugs have an appreciable solubility in lipophilic oils (especially triacyl glycerides) alone. It is therefore possible to administer the

drug as a simple solution in a capsule and obtain satisfactory absorption and bioavailability. However, the dispersion kinetics of such a formulation cannot be expected to be as rapid as would be observed for a pre-dispersed system. The slow dispersion of the formulation is a major limitation of this dosage form.

Self-emulsifying Oil Systems

These are sometimes referred to as SEDDS ('self-emulsifying drug delivery systems') and comprise a mixture of an oil and a surfactant that spontaneously forms an oil-in-water emulsion when diluted with water. The solubility of the drug is typically enhanced by the presence of the surfactant - which is usually present in concentrations as high as or greater than 30%. Co-solvents such as ethanol, propylene glycol and polyethylene glycol are sometimes added in order to increase the solubility of the drug. This dosage form is a lipophilic, isotropic liquid which may be filled into capsules and which, when liberated from the capsule in the gastrointestinal tract, forms a dispersion of small drug-containing oil/surfactant droplets which spread rapidly. The main disadvantage of SEDDS relates to the presence of the large amounts of surfactant, which, apart from potentially having a harmful effect on the intestinal wall, adds to the cost and complexity of the formulation. Examples of such compositions are disclosed in US Patents Nos. 6436430 and 6284268.

Microemulsion preconcentrates

These are essentially similar to SEDDS and comprise isotropic mixtures of drug, lipid, surfactant and (if required) co-solvent and co-surfactant. As with the self-emulsifying drug delivery systems, on addition to an aqueous medium these systems disperse to form liquid/liquid dispersions. The primary

difference between microemulsion preconcentrates and SEDDS is the nature of the dispersion formed, where the microemulsion preconcentrates disperse to form thermodynamically stable microemulsions.

Microemulsions have been shown to enhance the bioavailability of lipophilic drugs but suffer from the same major disadvantage as for SEDDS - the very high level of surfactant needed for their formation. Examples of such compositions are disclosed in US Patents Nos. 5993858 and 6309665.

Liposomes

Liposomes consist of ordered layers of phospholipid molecules which encapsulate a central aqueous lumen. The possibility exists for lipophilic drugs to be solublised within the phospholipid layers. The drug carrying capabilities of liposomes are sufficient for use in parenteral formulations, but are not particularly suitable for use in oral dosage forms. Furthermore, liposomes are unstable and expensive to produce and therefore have limited potential for the delivery of lipophilic drugs. Examples of such compositions are disclosed in US Patents Nos. 4746516 and 6090407.

Other dosage forms include the conversion of microemulsions into solid or semisolid nano particles and the use of polyaphrons. US Patent No. 4999198 discloses a polyaphron comprising a continuous phase and a disperse phase in which a drug, specifically scopolamine, is carried. The patent describes the slow release of the drug from the polyaphron into a medium with which the polyaphron is in contact and in particular the transdermal delivery of drugs. The invention described here is different from that previously described in US Patent No. 4999198. No reference has previously been given to the use of such

polyaphrons as an oral delivery system which is compatible with hard or soft gelatin capsules. No. specific water to lipid phase ratio is given in the previous patent. Furthermore, scopolamine is the only drug specifically mentioned.

The disadvantages of the oral formulations for the delivery of lipophilic poorly water-soluble drugs have been discussed above. None of the current formulations is particularly satisfactory.

We have now developed a readily dispersible two-phase system for the oral delivery of poorly water-soluble drugs which has a low water content (less than 10% w/w water) and therefore gives the system a good compatibility with gelatin, thereby enabling the drug formulation to be encapsulated in hard or soft gelatin capsules. Furthermore, the two-phase system is simple to produce and requires the use of only a limited amount of potentially expensive and harmful surfactants.

Accordingly, the present invention provides an oral drug delivery system which comprises a biliquid foam comprising

from 1 to 10% by weight of a continuous hydrophilic phase,

from 70 to 98% by weight of a pharmaceutically acceptable oil which forms a discontinuous phase, the said pharmaceutically acceptable oil having dissolved or dispersed therein a poorly water-soluble drug in an amount of from 0.1 to 20% by weight

and the biliquid foam including therein from 0.5 to 5% by weight of a surfactant to enable the formation of a stable biliquid foam, all percentages being based upon the total weight of the formulation.

By the term "biliquid foam" which is used herein, which is also referred to in the art as a "polyaphron", is meant a non-isotropic dispersion of a non-polar liquid suspended in a continuous polar phase.

By the term "poorly water-soluble drug" as used herein is meant a drug which will dissolve in water in an amount of less than 1% by weight.

The pharmaceutically acceptable oil which is used in the present invention is preferably a mono-, di- or triglyceride, or a mixture thereof. In particular the mono-, di- or triglycerides are preferably the glycerol esters of fatty acids containing from 6 to 22 carbon atoms.

Examples of oils which may be used in the present invention include almond oil, babassu oil, blackcurrant seed oil, borage oil, canola oil, castor oil, coconut oil, cod liver oil, corn oil, cottonseed oil, evening primrose oil, fish oil, grapeseed oil, mustard seed oil, olive oil, palm kernel oil, palm oil, peanut oil, rapeseed oil, safflower oil, sesame oil, shark liver oil, soybean oil, sunflower oil, walnut oil, wheat germ oil, hydrogenated castor oil, hydrogenated coconut oil, hydrogenated cottonseed oil, hydrogenated palm oil, hydrogenated soybean oil, partially hydrogenated soybean oil, hydrogenated vegetable oil, modified triglycerides, caprylic/capric glycerides, fractionated triglycerides, glyceryl tricaprate, glyceryl tricaproate, glyceryl tricaprylate, glyceryl tricaprylate/caprate, glyceryl tricaprylate/caprate, glyceryl tricaprylate/caprate/laurate, glyceryl tricaprylate/caprate/linoleate, glyceryl tricaprylate/caprate/stearate, glyceryl trilaurate,

glyceryl trilinoleate, glyceryl trilinolenate, glyceryl trioleate, glyceryl triundecanoate, linoleic glycerides, saturated polyglycolized glycerides, synthetic medium chain triglyceride containing primarily C8-C_{12} fatty acid chains, medium chain triglycerides, long chain triglycerides, modified triglycerides, fractionated triglycerides, and mixtures thereof.

Examples of mono and diglycerides which may be used in the present invention include propylene glycol mono and diesters having from 15 to 40 carbon atoms, including hydrolysed coconut oils (e.g. Capmul MCM), hydrolysed corn oil (e.g. Maisine 35-1).

The monoglycerides and diglycerides are mono- or di-saturated fatty acid esters of glycerol having eight to sixteen carbon chain length.

Essential oils may also be used in the present invention.

The surfactant used in the present invention may be incorporated into either or both phases of the biliquid foam. The surfactant used in the present invention is preferably an alkyl polyglycol ether, an alkyl polyglycol ester, an ethoxylated alcohol, a polyoxyethylene sorbitan fatty acid ester, a polyoxyethylene fatty acid ester, an ionic or non-ionic surfactant, a hydrogenated castor oil/polyoxyethylene glycol adducts containing from 25 to 60 ethoxy groups, a castor oil/polyoxyethylene glycol adduct containing from 25 to 45 ethoxy groups, or a mixture thereof. The surfactant may be used in an amount of from 0.5 to 5% by weight of the biliquid foam but preferably issued in an amount of from 1 to 2% by weight of the biliquid foam.

A co-emulsifier may be used in the formation of the biliquid foams in an amount sufficient to complete the solubilization of the poorly water-soluble drug. A suitable co-emulsifier is a phosphoglyceride or a phospholipid, for example lecithin.

The continuous hydrophilic phase of the biliquid foam may comprise water or may comprise an aqueous phase which includes therein an additional component to reduce the affinity of the aqueous phase for a capsule forming material such as gelatin. The additional component may be a salt such as sodium chloride, or a co-solvent such as an aliphatic alcohol, polyethylene glycol, propylene glycol or glycerol, or mixtures thereof, or a gelling such as alginate gums or their salts, guar gum, locust bean gum, xanthan gum, gum acacia, gelatin, hydroxymethylcellulose hydroxyethylcellulose, hydroxypropylcellulose, carboxymethylcellulose or its salts, bentonites, magnesium aluminium silicates, "Carbomers" (salts of cross-linked polymers of acrylic acid), or glyceryl polymethacrylates or their dispersions in glycols, or any appropriate mixture of any of these polymers and gums.

Alternatively, the hydrophilic phase may be non-aqueous and may be, for example, an aliphatic alcohol, polyethylene glycol, propylene glycol or glycerol, or mixtures thereof.

Poorly water-soluble drugs which may be used in the present invention include the following:

Analgesics and anti-inflammatory agents: aloxiprin, auranofin, azapropazone, benorylate, diflunisal, etodolac, fenbufen, fenoprofen calcium, flurbiprofen, ibuprofen, indomethacin, ketoprofen,

meclofenamic acid, mefenamic acid, nabumetone, naproxen, oxyphenbutazone, phenylbutazone, piroxicam, sulindac.

Anthelmintics: albendazole, bephenium hydroxynaphthoate, cambendazole, dichlorophen, ivermectin, mebendazole, oxamniquine, oxfendazole, oxantel embonate, praziquantel, pyrantel embonate, thiabendazole.

Anti-arrhythmic agents: amiodarone HCl, disopyramide, flecainide acetate, quinidine sulphate.
Anti-bacterial agents: benethamine penicillin, cinoxacin, ciprofloxacin HCl, clarithromycin, clofazimine, cloxacillin, demeclocycline, doxycycline, erythromycin, ethionamide, imipenem, nalidixic acid, nitrofurantoin, rifampicin, spiramycin, sulphabenzamide, sulphadoxine, sulphamerazine, sulphacetamide, sulphadiazine, sulphafurazole, sulphamethoxazole, sulphapyridine, tetracycline, trimethoprim.

Anti-coagulants: dicoumarol, dipyridamole, nicoumalone, phenindione.

Anti-depressants: amoxapine, maprotiline HCl, mianserin HCl, nortriptyline HCl, trazodone HCl, trimipramine maleate.

Anti-diabetics: acetohexamide, chlorpropamide, glibenclamide, gliclazide, glipizide, tolazamide, tolbutamide.

Anti-epileptics: beclamide, carbamazepine, clonazepam, ethotoin, methoin, methsuximide, methylphenobarbitone, oxcarbazepine, paramethadione, phenacemide, phenobarbitone, phenytoin, phensuximide,

primidone, sulthiame, valproic acid.

Anti-fungal agents: amphotericin, butoconazole nitrate, clotrimazole, econazole nitrate, fluconazole, flucytosine, griseofulvin, itraconazole, ketoconazole, miconazole, natamycin, nystatin, sulconazole nitrate, terbinafine HCl, terconazole, tioconazole, undecenoic acid.

Anti-gout agents: allopurinol, probenecid, sulphin-pyrazone.

Anti-hypertensive agents: amlodipine, benidipine, darodipine, dilitazem HCl, diazoxide, felodipine, guanabenz acetate, isradipine, minoxidil, nicardipine HCl, nifedipine, nimodipine, phenoxybenzamine HCl, prazosin HCl, reserpine, terazosin HCl.

Anti-malarials: amodiaquine, chloroquine, chlorproguanil HCl, halofantrine HCl, mefloquine HCl, proguanil HCl, pyrimethamine, quinine sulphate.

Anti-migraine agents: dihydroergotamine mesylate, ergotamine tartrate, methysergide maleate, pizotifen maleate, sumatriptan succinate.

Anti-muscarinic agents: atropine, benzhexol HCl, biperiden, ethopropazine HCl, hyoscyamine, mepenzolate bromide, oxyphencylcimine HCl, tropicamide.

Anti-neoplastic agents and Immunosuppressants: aminoglutethimide, amsacrine, azathioprine, busulphan, chlorambucil, cyclosporin, dacarbazine, estramustine, etoposide, lomustine, melphalan, mercaptopurine, methotrexate, mitomycin, mitotane, mitozantrone, procarbazine HCl, tamoxifen citrate, testolactone.

Anti-protazoal agents: benznidazole, clioquinol, decoquinate, diiodohydroxyquinoline, diloxanide furoate, dinitolmide, furzolidone, metronidazole, nimorazole, nitrofurazone, ornidazole, tinidazole.

Anti-thyroid agents: carbimazole, propylthiouracil.

Anxiolytic, sedatives, hypnotics and neuroleptics: alprazolam, amylobarbitone, barbitone, bentazepam, bromazepam, bromperidol, brotizolam, butobarbitone, carbromal, chlordiazepoxide, chlormethiazole, chlorpromazine, clobazam, clotiazepam, clozapine, diazepam, droperidol, ethinamate, flunanisone, flunitrazepam, fluopromazine, flupenthixol decanoate, fluphenazine decanoate, flurazepam, haloperidol, lorazepam, lormetazepam, medazepam, meprobamate, methaqualone, midazolam, nitrazepam, oxazepam, pentobarbitone, perphenazine pimozide, prochlorperazine, sulpiride, temazepam, thioridazine, triazolam, zopiclone.

β-Blockers: acebutolol, alprenolol, atenolol, labetalol, metoprolol, nadolol, oxprenolol, pindolol, propranolol.

Cardiac Inotropic agents: amrinone, digitoxin, digoxin, enoximone, lanatoside C, medigoxin.

Corticosteroids: beclomethasone, betamethasone, budesonide, cortisone acetate, desoxymethasone, dexamethasone, fludrocortisone acetate, flunisolide, flucortolone, fluticasone propionate, hydrocortisone, methylprednisolone, prednisolone, prednisone, triamcinolone.

Diuretics: acetazolamide, amiloride, bendrofluazide, bumetanide, chlorothiazide, chlorthalidone, ethacrynic acid, frusemide, metolazone, spironolactone, triamterene.

Anti-parkinsonian agents: bromocriptine mesylate, lysuride maleate.

Gastro-intestinal agents: bisacodyl, cimetidine, cisapride, diphenoxylate HCl, domperidone, famotidine, loperamide, mesalazine, nizatidine, omeprazole, ondansetron HCl, ranitidine HCl, sulphasalazine.

Histamine H_1-Receptor Antagonists: acrivastine, astemizole, cinnarizine, cyclizine, cyproheptadine HCl, dimenhydrinate, flunarizine HCl, loratadine, meclozine HCl, oxatomide, terfenadine.

Lipid regulating agents: bezafibrate, clofibrate, fenofibrate, gemfibrozil, probucol.

Nitrates and other anti-anginal agents: amyl nitrate, glyceryl trinitrate, isosorbide dinitrate, isosorbide mononitrate, pentaerythritol tetranitrate.

Nutritional agents: betacarotene, vitamin A, vitamin B_2, vitamin D, vitamin E, vitamin K.

Opioid analgesics: codeine, dextropropyoxyphene, diamorphine, dihydrocodeine, meptazinol, methadone, morphine, nalbuphine, pentazocine.

Sex hormones: clomiphene citrate, danazol, ethinyl estradiol, medroxyprogesterone acetate, mestranol, methyltestosterone, norethisterone, norgestrel, estradiol, conjugated oestrogens,

progesterone, stanozolol, stibestrol, testosterone, tibolone.

Stimulants: amphetamine, dexamphetamine, dexfenfluramine, fenfluramine, mazindol.

Pharmaceutically acceptable salts, isomers and derivatives thereof may be substituted for these drugs. Mixtures of lipophilic drugs may be used where therapeutically effective.

The discontinuous phase of the present invention comprises 70 to 98% by weight, preferably from 80 to 96% by weight, more preferably from 90 to 95% by weight of the biliquid foam. The continuous hydrophilic phase comprises from 1 to 20% by weight, preferably from 2 to 10% by weight of the biliquid foam.

The oral drug delivery systems of the present invention are preferably presented in a unit dosage form. The preferred unit dosage form comprises capsules filled with the biliquid foam, for example hard or soft gelatin capsules. The use of the gelatin capsules is made possible by the low water content of the biliquid foam which ensures good compatibility both with the hard and soft gelatin capsules and the optional incorporation into the aqueous phase of an additional component which reduces the affinity of the aqueous phase for the capsule material. This is an advantage over the currently available lipid dispersions and provides a better bioavailability of the drug as compared to tablets.

Each unit dosage form will comprise from 0.5mg to 200mg of the drug in up to a 100mg dosage form.

The biliquid foams of the drug delivery systems may also be presented as dilutable concentrates which are infinitely dilutable in a co-solvent such as water or a water compatible aliphatic alcohol, polyethylene glycol, propylene glycol or glycerol, or mixtures thereof. Dilution of the biliquid foam preparations is possible and they may be incorporated into a drink, syrup or linctus.

The biliquid foam compositions of the present invention may also contain other additives such as preservatives or antimicrobial agents (for instance to prevent microbiological spoilage). These additives may be included in the non-polar liquid or the continuous phase.

It will be understood that the inclusion of these additives will be at the levels and with the type of materials which are found to be effective and useful. Care needs to be taken in the choice and amount of these additives to prevent compromise to the other performance advantages of the present invention.

Methods of producing biliquid foams are described in US-A-4486333 involving the preliminary formation of a gas foam in order to provide a sufficiently large surface area on which the biliquid foam can subsequently be formed. It has been found that the prior formation of a gas foam is not required to manufacture a stable biliquid foam, provided that a suitable stirring mechanism is provided in the manufacturing vessel.

Such an apparatus comprises a tank provided with a stirrer in which the stirrer blade breaks the interface between the liquid and air. A delivery device is provided through which the oil phase (non-

polar liquid), which will comprise the internal phase of the dispersion is delivered to the tank. The design of the delivery device is such that the rate of addition of the internal phase fluid can be controlled and varied during the production process. A feature of the production process is that the internal (oil) phase is added to the stirred aqueous phase slowly at first until sufficient droplets have been formed to constitute a large surface area for the more rapid formation of new droplets. At this point, the rate of addition of the oil phase may be increased.

The production process consists of the following steps:

1. The addition of one or more chosen surfactants to one or other or both phases (as previously determined by experiment).
2. The charging of the aqueous phase into the bottom of a process vessel.
3. The incorporation of the stirrer into the vessel so that it stirs the surface of the aqueous phase.
4. Adjustment of the stirrer speed to a previously determined level.
5. The slow addition of the internal (oil) phase containing the poorly water-soluble drug dissolved or dispersed therein whilst continuing to stir at the prescribed speed.
6. The speeding up of the rate of addition of the oil phase once a prescribed amount (usually between 5% and 10% of the total amount to be added) has been added.

The stirring rate and the rate of addition of the oil phase are variables, the values of which depend upon the detailed design of the manufacturing plant (in particular, the ratio of tank diameter to impeller

diameter), the physico-chemical properties of the oil phase and the nature and concentrations of the chosen surfactants. These can all be pre-determined by laboratory or pilot plant experiment.

It will be understood by those skilled in the art that other manufacturing methods may be used, as appropriate.

Although the stability of the biliquid foams is generally good, they may be stabilised by the addition of an aqueous gel and, accordingly, the present invention includes within its scope a stable dispersion which comprises from 1 to 80% by weight of a biliquid foam and from 20 to 99% by weight of an aqueous gel.

The aqueous gel will preferably be formed from a colloidal polymer or gum suspended in water, at a concentration of from 0.05 to 20% by weight, more preferably from 0.2 to 1% by weight. Suitable polymers or gums are, for example, alginate gums or their salts, guar gum, locust bean gum, xanthan gum, gum acacia, gelatin, hydroxymethylcellulose hydroxyethylcellulose, hydroxypropylcellulose, carboxymethylcellulose or its salts, bentonites, magnesium aluminium silicates, "Carbomers" (salts of cross-linked polymers of acrylic acid), or glyceryl polymethacrylates or their dispersions in glycols, or any appropriate mixture of any of these polymers and gums.

The present invention will be further described with reference to the following examples:

Biliquid Foam Preparation

A suitable vessel was charged with the aqueous phase of the biliquid foam. The drug was dissolved in the oil phase. The oil phase containing the drug was then added at a constant rate with stirring, using a sweep stirrer or an orbital mixer. After completion of the oil addition, the stirring was continued until the size of the oil droplets became stable or reached a desired size.

Example 1

	%	Weight(g)
Oil phase		
Caprylic/capric triglyceride	90	27
Halofantrine	5	1.5

Claims

1. An oral drug delivery system which comprises a biliquid foam comprising:

from 1 to 20% by weight of a continuous hydrophilic phase,

from 70 to 98% by weight of a pharmaceutically acceptable oil which forms a discontinuous phase, the said pharmaceutically acceptable oil having dissolved or dispersed therein a poorly water-soluble drug in an amount of from 0.1 to 20% by weight

and the biliquid foam including therein from 0.5 to 5% by weight of a surfactant to enable the formation of a stable biliquid foam, all percentages being based upon the total weight of the formulation.

2. An oral drug delivery system as claimed in claim 1 wherein the continuous hydrophilic phase is an aqueous phase.

3. An oral drug delivery system as claimed in claim 2 wherein the aqueous phase is water.

4. An oral drug delivery system as claimed in claim 2 wherein the aqueous phase incorporates a salt or a co-solvent therein.

5. An oral drug delivery system as claimed in claim 1 wherein the continuous hydrophilic phase is a non-aqueous solvent.

6. An oral drug delivery system as claimed in claim 5 wherein the non-aqueous solvent is an aliphatic alcohol, polyethylene glycol, propylene glycol or glycerol, or mixtures thereof.

7. An oral drug delivery system as claimed in any one of the preceding claims wherein the pharmaceutically acceptable oil is a mono-, di- or triglyceride, or a mixture thereof.

8. An oral drug delivery system as claimed in claim 7 wherein the mono-, di- or triglycerides are the glycerol esters of fatty acids containing from 6 to 22 carbon atoms.

9. An oral drug delivery system as claimed in any one of the preceding claims wherein the surfactant comprises an alkyl polyglycol ether, an alkyl polyglycol ester, an ethoxylated alcohol, a polyoxyethylene sorbitan fatty acid ester, a polyoxyethylene fatty acid ester, a polyoxyethylene fatty acid ester, an ionic or non-ionic surfactant, a hydrogenated castor oil/polyoxyethylene glycol adduct containing from 25 to 60 ethoxy groups, a castor oil/polyoxyethylene glycol adduct containing from 25 to 45 ethoxy groups, or mixtures thereof.

10. An oral drug delivery system as claimed in any one of the preceding claims which includes therein a co-emulsifier in an amount sufficient to complete the solubilization of the poorly water-soluble drug.

11. An oral drug delivery system as claimed in claim 10 wherein the co-emulsifier is a phosphoglyceride or a phospholipid.

12. An oral drug delivery system as claimed in any one of the preceding claims wherein the discontinuous phase comprises from 85 to 96% by weight of the biliquid foam.

13. An oral drug delivery system as claimed in claim

12 wherein the discontinuous phase comprises from 90 to 95% by weight of the biliquid foam.

14. An oral drug delivery system as claimed in any one of the preceding claims wherein the continuous hydrophilic phase comprises from 2 to 10% by weight of the biliquid foam.

15. An oral drug delivery system as claimed in any one of the preceding claims wherein the surfactant comprises from 1 to 2% by weight of the composition.

16. An oral drug delivery system as claimed in any one of the preceding claims wherein the poorly water-soluble drug is an analgesic or anti-inflammatory agent, an anthelmintic, an anti-arrhythmic agent, an anti-coagulant, an anti-depressant, an anti-diabetic, an anti-epileptic, an anti-fungal agent, an anti-gout agent, an anti-hypertension agent, an anti-malarial, an anti-migraine agent, an anti-muscarinic agent, an anti-neoplastic agent, an anti-protozoal agent, an anti-thyroid agent, an anxiolytic, sedative, hypnotic or neuroleptic agent, a corticosteroid, a diuretic, an anti-Parkinsonian agent, a gastro-intestinal agent, a histamine H-receptor antagonist, a lipid regulating agent, an anti-anginal agent, a nutritional agent, an opiod analgesic, a sex hormone, a stimulant, or a therapeutic mixture thereof.

17. An oral drug delivery system as claimed in any one of the preceding claims which is in a unit dosage form.

18. An oral drug delivery system as claimed in claim 17 wherein the unit dosage form comprises capsules filled with the biliquid foam.

19. An oral drug delivery system as claimed in claim 18 wherein the capsules are hard or soft gelatin capsules.

20. An oral drug delivery system as claimed in any one of claims 1 to 16 which is in the form of a dilutable concentrate.

21. An oral drug delivery system as claimed in claim 20 which is infinitely dilutable in a co-solvent.

TO WHOM IT MAY CONCERN

11 June 2009

I am a Fellow of the Institute of Chartered Accountants in England and Wales. During the period 2000 to 2005 I was Company Secretary of Disperse Technologies plc and a Director and Company Secretary of Disperse Limited. In those capacities I am able to confirm that during that entire period Disperse Limited was 100% owned by Disperse Technologies plc.

Yours faithfully

Richard Twydell FCA
